The Molecular Basis of Movement Disorders. Mutations in genes encoding proteins involved in cellular and neurotransmitter signaling have been associated with a wide variety of movement disorders, from the tremor of essential tremor to the muscle spasm of dystonia. From a molecular biology perspective, the challenge is to understand the complex pathophysiology of these disorders. An analysis of the distribution of known movement disorders gene mutations and other biomarkers can

begin to shed light on the function of these genes and the pathways that mediate their function. Understanding the pathways that mediate these changes will be crucial to understanding the pathophysiology of disease and will provide insights into the mechanisms underlying normal motor control and movement disorders.
